Explorer endoscopy face masks

For analgesic gas administration during endoscopy procedures

A range of full face PVC masks for analgesic gas administration during endoscopy procedures, which are single use to prevent the possibility of cross infection.

The Intersurgical Explorer endoscopy masks are designed to allow easy insertion of an endoscope probe into the nose or mouth whilst administering an analgesic gas. There are three one-way valves positioned on the mask (the size 1 mask has only one valve) which provide easy access from either side of the patient.

Principally used for bronchoscopy procedures, the analgesic gas is administered via the central 22mm port. These masks could also be used on patients undergoing a transoesophageal echocardiogram (T.O.E.) procedure.
